

GENOMIC PROFILE INFORMATION SYSTEMS AND METHODS**ABSTRACT**

5 A variety of methods and systems related to genomic profile information and
related participants are described. Participants can be encouraged to allow access to
their genomic profile information in a variety of ways. A peer-to-peer genomic
profile information network can be implemented. A collection of genomic profile
information for a large number of participants can be built, and anonymity of the
10 participants can be maintained. Participants can maintain custodial control over
their genomic profile information. Comparative tools and groups can help
participants identify and communicate with other participants having similar
information.
